

C.S.P.S. First Aid Course
Test 2

1. Performing a rapid but accurate assessment of an injured person is a critical function of ski patrollers. In which order is it done?
 - A. Priority assessment, critical intervention and transportation decision, early communication with base, and secondary examination.
 - B. Transportation decision, early communication with base, priority assessment, critical intervention, and secondary examination.
 - C. Priority assessment, transportation decision and early communication with base, critical intervention, and secondary examination.
 - D. Secondary examination, transportation decision and early communication with base, critical intervention and priority assessment.

2. When examining an injured person, an accurate assessment
 - A. will alleviate the injured persons pain;
 - B. prevent the patrollers with the toboggan from waiting;
 - C. may be the difference between life and death;
 - D. will always prevent a law suit.

3. The first priority is
 - A. a clear airway and breathing;
 - B. functioning circulatory system;
 - C. danger of further injury;
 - D. control of bleeding.

4. If you are uncertain about possible C-Spine injury, you should
 - A. ignore it;
 - B. manually stabilize the head and neck;
 - C. stop the assessment;
 - D. immediately call for help.

5. When possible, the patroller must approach the accident scene
 - A. from directly above the victim;
 - B. from directly below the victim;
 - C. face to face with the victim;
 - D. out of the way of the skiing public.

C.S.P.S. First Aid Course
Test 2

6. When would you begin the priority assessment
- A. after the victim has agreed to your offer of help;
 - B. if the victim fails to reply;
 - C. as you approach the scene of the incident;
 - D. it is not necessary to check for life threatening conditions if the victim replies.
7. You find a skier lying in the middle of the hill. You approach them and:
- A. put on rubber gloves and do a pulse check;
 - B. identify yourself and ask permission to help;
 - C. check for breathing and do a pulse check;
 - D. stabilize the skier's neck and wait for the toboggan.
8. While conducting a priority assessment with protective gloves on; there is minimal response to pain stimuli and at the same time the skier is moaning and twitching. What would your next action be?
- A. Check for drugs or alcohol.
 - B. Call for help.
 - C. Check circulation.
 - D. Open the airway.
9. When performing a priority assessment, priority injuries should be taken care of:
- A. After the secondary is complete
 - B. In the order that they are found
 - C. Before lunch
 - D. using a backboard
10. You come across a victim who is bleeding profusely unconscious, and not breathing, your first priority would be:
- A. control of bleeding;
 - B. level of consciousness;
 - C. clear airway and breathing;
 - D. functioning circulatory system.
